

Learning Experience:

I had one major hiccup in this whole project was the MoviePass class. I was having trouble with tracking what movies had been seen with the pass, and on what days. The solution I came up with was using a Hashmap to store the movies and the days they were seen in one value, and easily search through it to check for movies that had already been seen, and if movies had been seen on certain days.

I also had a couple different tries with how to structure the conditions for a MoviePass, as I found the conditions for the price calculation to be a little confusing. I'm also glad that I started this project earlier than I usually would, as it ended up taking a long time. I learned that after doing assignment 5.

I was glad I knew beforehand how to use interfaces, abstract classes, enums, and hashmaps. I remember when I was first learning how to program that these things confused me for a while, so it really helped me to know how to use them beforehand.
